

# Hot Chili Intersects Significant Copper-Gold, **Porphyry-style Mineralisation at La Verde**

202m grading 0.6% Copper, 0.3g/t Gold from 70m depth

Hot Chili geologist reviewing drill chips from drill hole DKP002 at La Verde

## **Highlights**

- First drill hole (DKP001) at La Verde intersects intercepts 174m grading 0.4% copper (Cu), 0.1g/t gold (Au) from 36m depth
- Second drill hole (DKP002), located 120m southeast of DKP001, recorded 308m grading 0.5% Cu and 0.3g/t Au from 46m depth to end of hole
  - including 202m grading 0.6% Cu, 0.3g/t Au from 70m depth
  - which includes 100m grading 0.7% Cu, 0.3g/t Au from 118m depth
- Results for 10 more drill holes pending and drill program expanded to 6,000m
- La Verde's porphyry footprint, measures approximately 850m by 700m; comparable to Hot Chili's higher-grade Cortadera Cuerpo 3 copper-gold porphyry, located 30km north
- Costa Fuego Copper-Gold Project Pre-feasibility Study (PFS) and Huasco Water PFS advancing towards release in Q1, 2025
- Treasury of approximately A\$25.7 million as of 30 September 2024

Contact

Hot Chili Limited (ASX: HCH) (TSXV: HCH) (OTCQX: HHLKF) ("Hot Chili" or the "Company") is pleased to confirm a significant copper-gold discovery, located approximately 30km south of the Company's Costa Fuego Copper-Gold Project's ("Costa Fuego" or "the Project") planned central processing hub in the coastal range of the Atacama region, Chile.

Assay results for the first two drill holes of a 4,000m drill programme being undertaken across the recently secured La Verde porphyry copper-gold target have returned a wide drilling intersection of 202m grading 0.6% Cu, 0.3g/t Au from 70m depth within a broader intersection of 308m grading 0.5% Cu and 0.3g/t Au from 46m depth to end of hole.

La Verde is part of Hot Chili's recent consolidation of the Domeyko landholding where the Company earlier executed the La Verde Option Agreement (see announcement dated 11th November 2024), which for the first time consolidated and provided access to drill test a large potential porphyry copper target footprint.

The historical La Verde open pit mine was previously exploited by private interests for shallow porphyry copper-style oxide mineralisation with limited drill testing outside the central lease or to depth.

A total of twelve RC drill holes for approximately 3,150m are complete with results returned for the first two Reverse Circulation (RC) holes of the first-pass drill programme. The first two drill holes (DKP001 and DKP002) were designed to (1) validate historic drilling intercepts, and (2) test the interpreted northern extension of the porphyry from the previously exploited open pit, respectively.

Drill hole DKP001 was successful in validating the most notable copper intercept from historic exploration drill results, returning a broad significant intersection containing multiple higher-grade zones:

#### DKP001 returned 174m grading 0.4% Cu, 0.1g/t Au from 36m depth

- including 10m grading 0.6% Cu, 0.1g/t Au from 72m, and
- including 26m grading 0.5% Cu, 0.1g/t Au from 96m, and
- including 22m grading 0.6% Cu, 0.2g/t Au from 144m

Drill hole DKP002 was located approximately 120m southeast of DKP001, with assay results returning a drill intersection, that exceeded the Company's expectations and suggests potential for a highergrade copper-gold zone within the La Verde porphyry:

A total of 308m grading 0.5% Cu, 0.3 g/t Au from 46m depth

- including 202m grading 0.6% Cu, 0.3 g/t Au from 70m depth,
- which includes 100m grading 0.7% Cu, 0.3 g/t Au from 118m depth

These consistent higher-grade results confirm the extension of the porphyry system almost 400m to the northeast of the open pit, a significant step out considering the existing pit measures approximately 200m x 400m. The higher-grade mineralisation is also located immediately beneath a gravel cover sequence which obscures the ultimate extent of the porphyry system. Oxide mineralisation is associated with copper clays and chalcocite up to approximately 80m vertical depth from surface with the primary sulphide mineralisation associated with chalcopyrite and pyrite.

Mineralisation appears to be open in all directions and where the system remains under cover.

Assay results are pending for ten RC drill holes, for which visual logging confirmed porphyry-style mineralisation associated with A- and B-type porphyry veining. Preliminary geological modelling indicates a +1% A + B vein footprint of ~850 m by ~700 m (refer to Figure 3a), based on detailed surface mapping and downhole logging.

The La Verde footprint is comparable to the +1% A + B vein footprint at Cuerpo 3 (1,000m by 750m) at the Company's Cortadera porphyry copper-gold deposit, located 30km to the north (refer to Figure 3b). Cuerpo 3 is the largest of Cortadera's three porphyries, a cornerstone to Costa Fuego's Indicated mineral resource base of 798Mt grading 0.45% CuEq for 3.6Mt Cu and 3.0Moz Au<sup>1</sup> and Inferred<sup>2</sup> mineral resource of 203Mt grading 0.31% CuEq for 0.5Mt Cu and 0.4Moz Au.

The Company is particularly pleased with the high gold to copper ratio returned in drill hole DKP002 with additional results pending.

Hot Chili has expanded the first-pass RC drill programme with an additional 2,000m planned, now expected to be complete in late January 2025.

Hot Chili has a strong balance sheet with A\$25.7 million in cash (as of 30 September 2024) and continues to advance two key development milestones planned for release in the first quarter of 2025 - Costa Fuego PFS and Water Supply Business Case Study PFS.

The Company looks forward to providing further updates as additional drill results are returned and exploration drilling activities progress at La Verde.

This announcement is authorised by the Board of Directors for release to ASX and TSXV.

Notes to Table 1: Significant intercepts for La Verde are calculated above a nominal cut-off grade of 0.2% Cu. Where appropriate, significant intersections may contain up to 30m down-hole distance of internal dilution (less than 0.2% Cu). Significant intersections are separated where internal dilution is greater than 30m down-hole distance. The selection of 0.2% Cu for significant intersection cut-off grade is aligned with marginal economic cut-off grade for bulk tonnage polymetallic copper deposits of similar grade in Chile and elsewhere in the world.

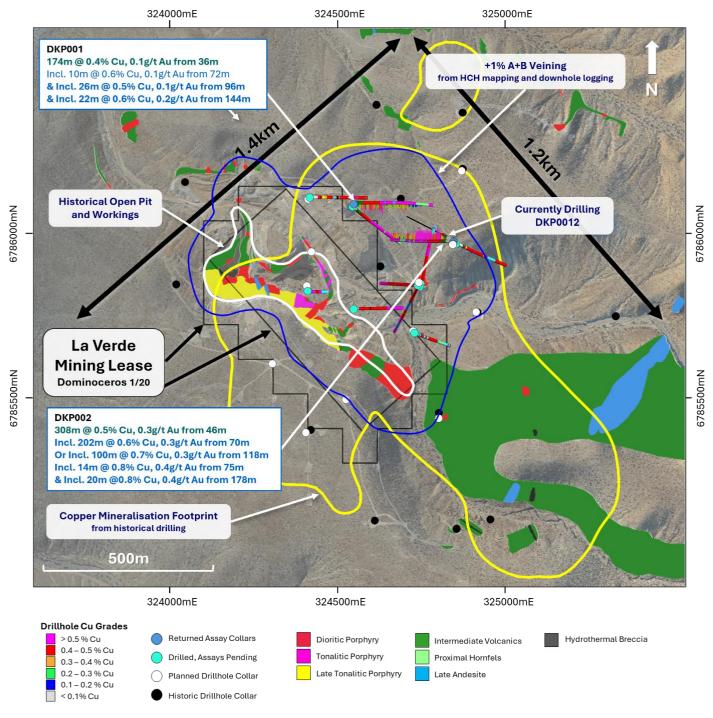

Figure 2. Plan view map of the La Verde porphyry system showing the significant intercepts of DKP001 and DKP002 compared to historic drill collars, open pit extent (white), in pit geological mapping, +1% A+B vein footprint from mapping and drillholes (blue) and logged copper mineralisation footprint from historic logging (yellow).

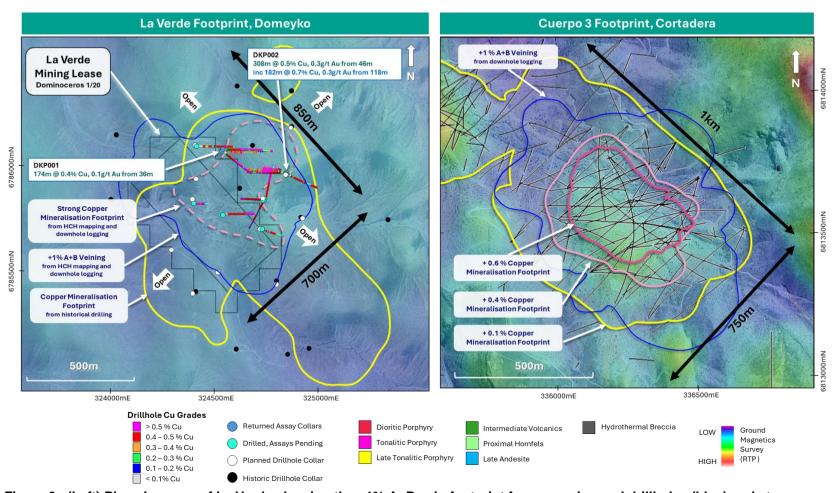

Figure 3a (Left) Plan view map of La Verde showing the +1% A+B vein footprint from mapping and drillholes (blue) and strong copper mineralisation footprint (light pink) relative to the copper mineralisation footprint from historic logging (yellow) with the recently acquired ground magnetic survey reduced to the pole (RTP).

Figure 3b (Right) Plan view map of Cuerpo 3 at Cortadera showing the +1% A+B vein footprint (from drillholes) relative to the +0.1% copper (yellow), +0.4% copper (light pink) and +0.6% copper (dark pink) interpolants with the ground magnetics survey reduced to the pole (RTP). Black arrows and distances indicate the length and width of +1% A+B vein footprints.

### **Qualifying Statements**

#### Qualified Person - NI 43-101

The technical information in this news release has been reviewed and approved by Mr. Christian Easterday, MAIG, Hot Chili's Managing Director and a qualified person within the meaning of NI43-101.

#### **Competent Person - JORC**

The information in this announcement that relates to Exploration Results for the La Verde project is based upon information compiled by Mr Christian Easterday, the Managing Director and a full-time employee of Hot Chili Limited, who is a Member of the Australasian Institute of Geoscientists (AIG). Mr Easterday has sufficient experience that is relevant to the style of mineralisation and type of deposits under consideration and to the activity which he is undertaking to qualify as a 'Competent Person' as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (JORC Code). Mr Easterday consents to the inclusion in the report of the matters based on their information in the form and context in which it appears.

#### **Disclaimer**

Neither the TSX Venture Exchange nor its Regulation Services Provider (as that term is defined in the policies of the TSX Venture Exchange) accepts responsibility for the adequacy or accuracy of this Report.

#### **Forward Looking Statements**

This announcement contains certain statements that are "forward-looking information" within the meaning of Canadian securities legislation and Australian securities legislation (each, a "forward-looking statement"). Forward-looking statements reflect the Company's current expectations, forecasts, and projections with respect to future events, many of which are beyond the Company's control, and are based on certain assumptions. No assurance can be given that these expectations, forecasts, or projections will prove to be correct, and such forward-looking statements included in this report should not be unduly relied upon. Forward-looking information is by its nature prospective and requires the Company to make certain assumptions and is subject to inherent risks and uncertainties. All statements other than statements of historical fact are forward-looking statements. The use of any of the words "could", "estimate", "expect", "expectations", "interpreted", "may", "plan", "planned", "potential", "project", "should", "will", "would" and similar expressions are intended to identify forward-looking statements.

The forward-looking statements within this announcement are based on information currently available and what management believes are reasonable assumptions. Forward-looking statements speak only as of the date of this report.

In this announcement, forward-looking statements relate, among other things, to: prospects, projections and success of the Company and its projects; the ability of the Company to expand mineral resources beyond current mineral resource estimates, including at La Verde; the results and impacts of planned drilling to extend mineral resources and to identify new deposits, including at La Verde; the metallurgical recoveries of any oxide and/or sulphide mineral resources defined at La Verde; the Company's ability to convert exploration potential into mineral resources, such as at La Verde; the Company's ability to explore effectively and execute drilling operations in a timely manner, including at La Verde; the Company's ability to fulfill obligations and exercise the La Verde and Domeyko Option Agreements; the Company's ability to convert mineral resources currently defined and those that may be defined through additional drilling to mineral reserves; the timing and outcomes of current and future planned economic studies including the planned PFS for the Costa Fuego copper-gold project; the potential to develop a water business in the Huasco valley and the future economics thereof; the timing and results of the PFS level Water Supply Business Case Study; the timing and outcomes of regulatory processes required

P: +61 8 9315 9009 F: +61 8 9315 5004. <u>www.hotchili.net.au</u>

to obtain permits for the development and operation of the Costa Fuego Project, including the EIA, as well as for the Huasco Water business and any mineral resources that may be defined at La Verde; whether or not the Company will make a development decision for the Costa Fuego Project and/or Huasco Water and the timing thereof; and estimates of planned exploration costs and the results thereof.

Forward-looking statements involve known and unknown risks, uncertainties, and other factors, which may cause the actual results, performance, or achievements of the Company to be materially different from any future results, performance or achievements expressed or implied by the forward-looking statements. A number of factors could cause actual results to differ materially from a conclusion, forecast or projection contained in the forward-looking statements in this announcement, including, but not limited to, the following material factors: operational risks; risks related to the cost estimates of exploration; sovereign risks associated with the Company's operations in Chile; changes in estimates of mineral resources of properties where the Company holds interests; recruiting qualified personnel and retaining key personnel; future financial needs and availability of adequate financing; fluctuations in mineral prices; market volatility; exchange rate fluctuations; ability to exploit successful discoveries; the production at or performance of properties where the Company holds interests; ability to retain title to mining concessions; environmental risks; financial failure or default of joint venture partners, contractors or service providers; competition risks; economic and market conditions; and other risks and uncertainties described elsewhere in this announcement and elsewhere in the Company's public disclosure record.

Although the forward-looking statements contained in this announcement are based upon assumptions which the Company believes to be reasonable, the Company cannot assure investors that actual results will be consistent with these forward-looking statements. With respect to forward-looking statements contained in this announcement, the Company has made assumptions regarding: future commodity prices and demand; availability of skilled labour; timing and amount of capital expenditures; future currency exchange and interest rates; the impact of increasing competition; general conditions in economic and financial markets; availability of drilling and related equipment; effects of regulation by governmental agencies; future tax rates; future operating costs; availability of future sources of funding; ability to obtain financing; and assumptions underlying estimates related to adjusted funds from operations. The Company has included the above summary of assumptions and risks related to forward-looking information provided in this announcement to provide investors with a more complete perspective on the Company's future operations, and such information may not be appropriate for other purposes. The Company's actual results, performance or achievement could differ materially from those expressed in, or implied by, these forward-looking statements and, accordingly, no assurance can be given that any of the events anticipated by the forward-looking statements will transpire or occur, or if any of them do so, what benefits the Company will derive therefrom.

For additional information with respect to these and other factors and assumptions underlying the forward-looking statements made herein, please refer to the public disclosure record of the Company, including the Company's most recent Annual Report, which is available on SEDAR+ (www.sedarplus.ca) under the Company's issuer profile. New factors emerge from time to time, and it is not possible for management to predict all those factors or to assess in advance the impact of each such factor on the Company's business or the extent to which any factor, or combination of factors, may cause actual results to differ materially from those contained in any forward-looking statement.

The forward-looking statements contained in this announcement are expressly qualified by the foregoing cautionary statements and are made as of the date of this announcement. Except as may be required by applicable securities laws, the Company does not undertake any obligation to publicly update or revise any forward-looking statement to reflect events or circumstances after the date of this announcement or to reflect the occurrence of unanticipated events, whether as a result of new information, future events or results, or otherwise. Investors should read this entire announcement and consult their own professional advisors to ascertain and assess the income tax and legal risks and other aspects of an investment in the Company.

- 1 Mineral Resources are reported on a 100% Basis combining Mineral Resource estimates for the Cortadera, Productora, Alice and San Antonio deposits. All figures are rounded, reported to appropriate significant figures and reported in accordance with the Joint Ore Reserves Committee Code (2012) and NI 43-101, Mineral Resource estimation practices are in accordance with CIM Estimation of Mineral Resource and Mineral Reserve Best Practice Guidelines (November 29, 2019) and reported in accordance CIM Definition Standards for Mineral Resources and Mineral Reserves (May 10, 2014) that are incorporated by reference into NI 43-101.
- 2 The Productora deposit is 100% owned by Chilean incorporated company Sociedad Minera El Aguila SpA (SMEA). SMEA is a joint venture (JV) company 80% owned by Sociedad Minera El Corazón SpA (a 100% subsidiary of Hot Chili Limited), and 20% owned by Compañía Minera del Pacífico S.A (CMP).
- 3 The Cortadera deposit is controlled by a Chilean incorporated company Sociedad Minera La Frontera SpA (Frontera). Frontera is a subsidiary company 100% owned by Sociedad Minera El Corazón SpA, which is a 100% subsidiary of Hot Chili Limited.
- 4 The San Antonio deposit is controlled through Frontera (100% owned by Sociedad Minera El Corazón SpA, which is a 100% subsidiary of Hot Chili Limited) and Frontera has an Option Agreement to earn a 100% interest.
- 5 The Mineral Resource Estimates (MRE) in the tables above form coherent bodies of mineralisation that are considered amenable to a combination of open pit and underground extraction methods based on the following parameters: Base Case Metal Prices: Copper US\$ 3.00/lb, Gold US\$ 1,700/oz, Molybdenum US\$ 14/lb, and Silver US\$20/oz.
- 6 All MRE were assessed for Reasonable Prospects of Eventual Economic Extraction (RPEEE) using both Open Pit and Block Cave Extraction mining methods at Cortadera and Open Pit mining methods at the Productora, Alice and San Antonio deposits.
- 7 Metallurgical recovery averages for each deposit consider Indicated + Inferred material and are weighted to combine sulphide flotation and oxide leaching performance. Process recoveries:  $Cortadera - Weighted recoveries of 82\% \ Cu, 55\% \ Au, 81\% \ Mo \ and 36\% \ Ag. \ CuEq(\%) = Cu(\%) + 0.55 \times Au(g/t) + 0.00046 \times Mo(ppm) + 0.0043 \times Ag(g/t) + 0.0046 \times Mo(ppm) + 0.0043 \times Ag(g/t) + 0.0046 \times Mo(ppm) + 0.0043 \times Ag(g/t) + 0.0046 \times Mo(ppm) + 0.0046 \times Mo(ppm) + 0.0043 \times Ag(g/t) + 0.0046 \times Mo(ppm) + 0.0046 \times Mo(ppm) + 0.0043 \times Ag(g/t) + 0.0046 \times Mo(ppm) + 0.0046 \times Mo(ppm) + 0.0043 \times Ag(g/t) + 0.0046 \times Mo(ppm) + 0.0046 \times Mo(ppm) + 0.0043 \times Ag(g/t) + 0.0046 \times Mo(ppm) + 0.0046$

San Antonio - Weighted recoveries of 85% Cu, 66% Au, 80% Mo and 63% Ag. CuEq(%) = Cu(%) + 0.64 x Au(g/t) + 0.00044 x Mo(ppm) + 0.0072 x Ag(g/t)

Alice - Weighted recoveries of 81% Cu, 47% Au, 52% Mo and 37% Ag. CuEq(%) = Cu(%) + 0.48 x Au(g/t) + 0.00030 x Mo(ppm) + 0.0044 x Ag(g/t)

Productora – Weighted recoveries of 84% Cu, 47% Au, 48% Mo and 18% Ag. CuEq(%) = Cu(%) + 0.46 x Au(g/t) + 0.00026 x Mo(ppm) + 0.0021 x Ag(g/t)

Costa Fuego - Recoveries of 83% Cu, 53% Au, 71% Mo and 26% Ag. CuEq(%) = Cu(%) + 0.53 x Au(g/t) + 0.00040 x Mo(ppm) + 0.0030 x Ag(g/t)

- 8 Copper Equivalent (CuEq) grades are calculated based on the formula: CuEq% = ((Cu% x Cu price 1% per tonne x Cu recovery) + (Mo ppm x Mo price per g/t x Mo recovery) + (Au ppm × Au price per g/t × Au\_recovery) + (Ag ppm × Ag price per g/t × Ag\_recovery)) / (Cu price 1% per tonne × Cu recovery). The base case cut-off grade for Mineral Resources considered amenable to open pit extraction methods at the Cortadera, Productora, Alice and San Antonio deposits is 0.20% CuEa, while the cut-off grade for Mineral Resources considered amenable to underground extraction methods at the Cortadera deposit is 0.27% CuEq. It is the Company's opinion that all the elements included in the CuEq calculation have a reasonable potential
- 9 Mineral Resources are not Mineral Reserves and do not have demonstrated economic viability. The MRE include Inferred Mineral Resources that are considered too speculative geologically to have economic considerations applied to them that would enable them to be categorised as Mineral Reserves. It is reasonably expected that the majority of Inferred mineral resources could be upgraded to Measured or Indicated Mineral Resources with continued exploration.
- 10 The effective date of the MRE is February 26th, 2024. The MRE were previously reported in Hot Chili's ASX announcement released February 26th, 2024 "Hot Chili Indicated Resource at Costa Fuego Copper-Gold Project Increases to 798 Mt" (Resource Announcement). Hot Chili confirms it is not aware of any new information or data that materially affects the information included in the Resource Announcement and all material assumptions and technical parameters stated for the MRE in the Resource Announcement continue to apply and have not materially changed
- 11 Hot Chili Limited is not aware of political, environmental, or other risks that could materially affect the potential development of the Mineral Resources other than as disclosed in this Report. A detailed list of Costa Fuego Project risks is included in Chapter 25.12 of the Technical Report "Costa Fuego Copper Project - NI 43-101 Technical Report Mineral Resource Estimate Update" dated April 8th, 2024.

### JORC Code Table 1 for La Verde within the Domeyko Project

The following table provides a summary of important assessment and reporting criteria used for the reporting of Mineral Resource and Ore Reserves in accordance with the Table 1 checklist in the Australasian Code for the Reporting of Exploration Results, Minerals Resources and Ore Reserves (The JORC Code, 2012 Edition).

The San Antonio MRE will be reported to the standard of the Canadian National Instrument 43-101 "Standards of Disclosure for Mineral Projects", and as such has been completed by a Qualified Person (QP). A QP under NI43-101 guidelines is interchangeable with a Competent Person (CP) under the JORC Code and has been referred to as such below.

The follow list provides the names and the sections for Competent Person responsibilities:

Section 1 and 2: C. Easterday - MAIG (Hot Chili Limited)

#### **Section 1 Sampling Techniques and Data**

Criteria	JORC Code explanation	Commentary
Sampling techniques	Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.  Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.  Aspects of the determination of mineralisation that are Material to the Public Report.  In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	Drilling  All drilling undertaken by Hot Chili Limited ("HCH" or "the Company") is Reverse Circulation (RC). Drilling has been carried out under Hot Chili (HCH) supervision by an experienced drilling contractor (BlueSpec Drilling).  The RC drilling completed by HCH reached an average depth of 275 meters.  RC drilling produced a 1m bulk sample and representative 2m samples (nominally a 12.5% split) were collected using a cone splitter, with sample weights averaging 5 kg.  Geological logging was completed, and mineralised sample intervals were determined by the geologists to be submitted as 2m samples for RC. In RC intervals assessed as unmineralised, 4m composite (scoop) samples were collected for analysis. If these 4m composite samples return results with anomalous grade the corresponding original 2m split samples are then submitted to the laboratory for analysis.  Both RC samples were crushed and split at the laboratory, with up to 1kg pulverised, and a 50g pulp sample analysed by industry standard methods -ICP-OES (33 element, 4 acid digest) and Au 30-gram fire assay.  Every 50th metre downhole was also assayed by ME-MS61 (48 element, 4 acid digest) for exploration targeting purposes.  Sampling techniques used are deemed appropriate for exploration and resource estimation purposes for this style of deposit and mineralisation.  Historical Drilling: Existing drilling at the Domeyko project comprises eight Reverse Circulation (RC) holes drilled for a total of 2,299 m (drilled in 2010), and twelve Diamond Core (DD) holes drilled for a total of 5,774 m (drilled between 2012 and 2014).  Available data pertaining to these campaigns of drilling is incomplete and unverifiable; as such HCH due diligence is continuing, and results of these drill holes are considered to be of low confidence and not presently material.  Surface Geochemistry  A 400 m x 200 m grid spaced soil program has been undertaken by HCH across the broader project area, with infill soil sampling on a 200 m x 100 m grid over the La Verde open pit area,

Criteria	JORC Code explanation	Commentary
		Soil samples at Domeyko were collected at a pre-determined sampling point by navigating to the WGS84 UTM co-ordinates with hand-held GPS, then digging a hole 30 x 30 cm and 20 cm deep.
		The first 10 to 15 cm of organic matter and soil were removed before residual soil was then placed through a 2mm sieve, with a ~500 g sample of the fine fraction collected in a pre-labelled calico bag.
		At each sampling point an excel spreadsheet was populated with the sample type e.g. Regolith, Colluvium or Alluvium.
		All samples were tested by HCH personnel using an Olympus "Vanta" portable XRF and their magnetic susceptibility measured with an industry standard KT-10 magsus meter. Each sample underwent subsequent multielement analysis by ALS laboratories.
		Rock chip samples have been collected sporadically across the project areas by HCH geologists during geological mapping activities. These samples have been taken from locations of interest as hand gathered float samples, or as fresh chips broken from outcrop with a hammer. In all cases a sample of around 2kg has been taken in a calico bag, geologically described and the GPS location recorded.
Drilling	Drill type (eg core, reverse circulation, open-hole	HCH drilling consisted of RC with face sampling bit (143 to 130mm diameter) ensuring minimal contamination during sample extraction.
techniques	hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or	2012 to 2014 DD drilling by Hudbay Minerals Inc. used HQ3 bits (61.1 mm internal diameter). Drill core was not oriented.
	standard tube, depth of diamond tails, face- sampling bit or other type, whether core is	No information is available regarding the conduct of the 2010 RC drilling campaign.
	oriented and if so, by what method, etc).	
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed.	HCH Drilling: Drilling techniques to ensure adequate RC sample recovery and quality included the use of "booster" air pressure. Air pressure used for RC drilling was 700-800psi.
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	Logging of all samples followed established company procedures which included recording of qualitative fields to allow discernment of sample quality. This included (but was not limited to) recording: sample condition (wet, dry, moist), sample recovery (poor, moderate, good), sample method (RC: scoop, cone).
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain	The majority of HCH drilling had acceptable documented recovery and expectations on the ratio of wet and dry drilling were met, with no bias detected between the differing sample conditions.
	of fine/coarse material.	Historical Drilling: No information is available on historic RC drill sample recovery. Diamond core recovery was recorded in a provided spreadsheet, which HCH has reviewed against the core photographs. Overall, good core recovery is observed.
		At the current early exploration stage, it is unclear whether there is a relationship between sample recovery and grade.
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource	HCH Drilling: Detailed descriptions of RC chips were logged qualitatively for lithological composition and texture, structures, veining, alteration, and copper speciation. Visual percentage estimates were made for some minerals, including sulphides.
	estimation, mining studies and metallurgical studies.	Geological logging was recorded in a systematic and consistent manner such that the data was able to be interrogated accurately using modern mapping and 3D geological modelling software programs. Field logging templates were used to record details related to each drill hole.
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc)	Historical Drilling: Geological logs were provided as part of the data package for all drilling (DD and RC).
	photography.	For DD, these logs have been reviewed against core photographs and are deemed to be of a reasonable standard for an early exploration target.
	The total length and percentage of the relevant intersections logged.	For RC, as chips and chip tray photographs are not available, no validation has been completed.

	Measures taken to ensure that the sampling is	ALS method ME-ICP61 involves a 4-acid digestion (Hydrochloric-Nitric-Perchloric-Hydrofluoric) followed by ICP-AES determination.
	representative of the in situ material collected, including for instance results for field	Samples that returned Cu grades >10,000ppm were analysed by ALS "ore grade" method Cu-AA62, which is a 4-acid digestion, followed by Ameasurement to 0.001%Cu.
	duplicate/second-half sampling.  Whether sample sizes are appropriate to the	Samples determined by geologists to be either oxide or transitional were also analysed by Cu-AA05 method to determine copper solubility (by sulplacid).
	grain size of the material being sampled.	Pulp samples were analysed for gold by ALS method Au-AA23 (Au 30g FA-AA finish) and Au-GRA21 for Au overlimit (Au by fire assay and gravim finish, 30g). ALS method ME-MS61 is completed on pulps for every 50th metre downhole, it involves a 4-acid digestion (Hydrochloric-Nitric-Perchl Hydrofluoric) followed by ICP-MS determination.
		Field duplicates were collected for RC drill samples at a rate of 1 in 50 drill metres i.e. 1 in every 25 samples (when 2m sampling intervals observed the procedure involves placing a second sample bag on the cone splitter to collect a duplicate sample.
		For historic drilling competed at La Verde no information is available on sub-sampling techniques, other than the sub-sampling being completed m intervals for DD and 1 m intervals from the bulk sample for RC.
		Limited information is available regarding the sample preparation and assaying methodology of the DD and RC samples, it appears that mul methods have been used and compiled into the available assay tables without supporting documentation available for verification.
		Surface Geochemistry
		Each sample underwent multielement analysis by ALS laboratories.
		ALS Soil sample preparation included drying samples at <60°C/140°F, then sieving samples to -180 micron (80 mesh). Each sample was analysed by ALS method ME-MS61 4-acid digestion followed by ICP-MS determination, with gold analysis by Au-ICP21 (30 g Fire Assay ICP-finish).
		Rock chip samples submitted to ALS were dried, crushed to a nominal 20mm size and split, with around 400g pulverised and a subsequent pulp sample analysed by ALS method ME-MS61 4-acid digestion followed by ICP-MS determination, with gold analysis by Au-ICP21 (30 g Fire Assay AES finish).
uality of	The nature, quality and appropriateness of the	<u>Drilling</u>
ssay data nd boratory	assaying and laboratory procedures used and whether the technique is considered partial or total.	All HCH drill samples were assayed by industry standard methods through accredited ALS laboratories in Chile and Peru. Typical analytical methods through accredited in the previous section and are considered 'near total' techniques.
ests	For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument	HCH undertakes several steps to ensure the quality control of assay results. These include, but are not limited to, the use of duplicates, centerence material (CRM) and blank media:

Criteria	JORC Code explanation	Commentary
	make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg	Routine 'standard' (mineralised pulp) Certified Reference Material (CRM) was inserted at a nominal rate of 1 in 25 samples.  Routine 'blank' material (unmineralised quartz) was inserted at a nominal rate of 3 in 100 samples at the logging geologist's discretion - with particular weighting towards submitting blanks immediately following mineralised field samples.
	standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	Routine field duplicates for RC samples were submitted at a rate of 1 in 25 samples.  Analytical laboratories provided their own routine quality controls within their own practices. No significant issues have been noted.  All results are checked in the acQuire™ database before being used, and analysed batches are continuously reviewed to ensure they are performing within acceptable tolerance for the style of mineralisation.  HCH has not completed a comprehensive review of QA/QC data from historical drilling.  Surface Geochemistry  All soil samples collected at Domeyko were scanned using an Olympus "Vanta" portable XRF and tested for magnetic susceptibility with a portable KT-10 meter.  Routine QA/QC standards are used at the beginning and end of each XRF campaign in addition to every 50 XRF measurements recorded. Standards have been selected to represent typical multi-element distribution for the style of deposit being analysed.  Routine comparison of soil sample XRF and assay results is completed at the end of each soil geochemical campaign.  Soil and rock chip samples were also submitted to ALS for multielement analysis by ME-MS61 method. This method provides 48 element analysis at very low detection limits, suitable for mapping lithology from geochemistry. Analysis involves HNO <sub>3</sub> -HCIO <sub>4</sub> -HF acid digestion, HCI leach, dissolving nearly all minerals, this is paired with ICP-MS and ICP-AES analysis. This technique is appropriate for this type of sample and is considered total.
		The analytical laboratories provided routine quality controls within their own practices. No significant issues have been noted. No company standards or blanks are submitted by HCH.  All results are checked in the acQuire™ database before being used, and analysed batches are continuously reviewed to ensure they are performing within acceptable tolerance for the style of mineralisation.
Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel.  The use of twinned holes.  Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.  Discuss any adjustment to assay data.	All assay results have been compiled and verified to ensure veracity of assay results and the corresponding sample data. This includes a review of QA/QC results to identify any issues prior to incorporation into the Company's geological database.  No adjustment has been made to assay data following electronic upload from original laboratory certificates to the database. Where samples returned values below the detection limit, these assay values were set to half the lowest detection limit for that element.  The capture of drill logging data was managed by a computerised system and strict data validation steps were followed. The data is stored in a secure acQuire™ database with modification access restricted to a dedicated database manager.  Documentation of primary data, data entry procedures, data verification and data storage protocols have all been validated through internal database checks and by a third-party audit completed in 2022.  Visualisation and validation of drill data was also undertaken in 3D using multiple software packages - Datamine and Leapfrog with no errors detected. Historical Drilling: No assays are being reported as the quality of supplied drill data cannot be verified.  One historic drillhole has been validated, returning comparable copper results. Further validation and twin holes are required.  DD and RC sampling and assay results have been supplied as basic compiled spreadsheet format. The lack of information regarding sample chain of custody procedures and analytical methods has limited the use of the data to exploration targeting until a future verification campaign with remaining available core samples and/or twinning of existing holes.

	procedure(s) and classifications applied.  Whether sample compositing has been applied.	A 400 x 200 m grid spacing soil program with a total of 1181 samples has been taken across the Domeyko leases. The soil sample lines were designed on E-W grid with WGS84 UTM 19S point locations. This sample spacing is considered appropriate for first pass soil geochemical sampling.  Rock chips have been collected in a non-representative spacing, and do not reflect the character of the wider project area. This sampling cannot be relied upon to imply geological or grade continuity.
Orientation of data in relation to geological structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.  If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	The majority of drilling was oriented from -60° toward the east or west. In addition, some other drill orientations were used to ensure geological representivity and to maximise the use of available drill platforms.  The orientation of drilling is considered appropriate for this style of mineralisation, and no sampling bias is inferred from drilling completed as. In addition, copper-gold porphyry mineralisation is typically homogenous meaning a limited chance of bias is likely to be caused from drilling orientation.
Sample security	The measures taken to ensure sample security.	For HCH data, a strict chain of custody procedures were adhered to. All samples have the sample submission number/ticket inserted into each bulk polyweave sample bag with the id number clearly visible. The sample bag is stapled together such that no sample material can spill out and no one can tamper with the sample once it leaves Hot Chili custody.  The measures taken to ensure sample security for drilling completed by Hudbay Minerals Inc. are unknown.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	None completed.

Geology	Deposit type, geological setting and style of mineralisation.	Surface mapping is ongoing across the Domeyko project, which will increase understanding of the individual prospects contained within.  The copper mineralisation at the La Verde prospect is associated with multiple porphyry intrusions, with historical mining activity confined to a zone of overlying supergene copper oxides. The relationship between this supergene zone and the suspected primary porphyry mineralisation is not yet understood.  These porphyries have intruded into, and the vein systems cut through, the Cretaceous Bandurrias and Chañarcillo Formations (variously stratified agglomerates, volcanic breccias, dacitic tuffs and limestones). Most of the western portion of the project area is overlain by eroded Atacama Gravel sequences, with elongate fingers of the gravels extending across to the eastern boundary.							
Drillhole Information  A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:  The coordinates and orientations for HCH holes are tabulated in table 1 of the announcement of the coordinates and orientations for all historic holes are tabulated below:						announcement text.

Data aggregation methods	In reporting Exploration Results, weighting averaging techniques, maximum and/or										
	minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.	Significant intercepts for La Verde are calculated above a nominal cut-off grade of 0.2% Cu. Where appropriate, significant intersections may contain up to 30m down-hole distance of internal dilution (less than 0.2% Cu). Significant intersections are separated where internal dilution is greater than 30m down-hole distance. The selection of 0.2% Cu for significant intersection cut-off grade is aligned with marginal economic cut-off grade for bull tonnage polymetallic copper deposits of similar grade in Chile and elsewhere in the world.  No top cuts have been considered in reporting of grade results, nor was it deemed necessary for the reporting of significant intersections.									
	Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.										
	The assumptions used for any reporting of metal equivalent values should be clearly stated										
Relationship between mineralisation widths and intercept lengths	These relationships are particularly important in the reporting of Exploration Results.	The relationship of mineralisation widths to the intercepts for historic drilling is unknown.									
	If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.										
	If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known')										
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Refer to figures	in the anno	uncement.							

Criteria	JORC Code explanation	Commentary
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	The coordinates and orientations for all HCH drill holes at La Verde have been reported in table 1 of the announcement text.  No historical drilling information has been verified to the satisfaction of the company.  All drill hole locations are reported as supplied to the company.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	A ground magnetic survey was conducted in June and July 2024 by Argali Geofisica Chile E.I.R.L. (Argali) on behalf of Hot Chili Limited. The survey was conducted on north-south lines with a spacing of 100 m for a total of 1791 km. Readings were acquired as a continuous profile once every 1 second or an approximate station spacing of approximately 0.5 to 1.5 m. The survey was competed in WGS84, Zone 19S and has been visualised as a pole reduced magnetic map (RTP).  Available historical data from previous exploration includes surface mapping, surface geochemical surveys and geophysical surveys (Ground magnetics and Induced Polarisation surveys).  Historic surface geochemical sampling programs of both rock chip and soil samples have been undertaken over the project, however, the inconsistent distribution, presence of extensive later cover sequences and questionable QA/QC status of the data has led the company to consider the results unreliable.  A Titan-24 IP/MT survey was conducted in April and June 2008 by Quantec Geoscience Ltd. on behalf of Hudbay Minerals Inc. (as then subsidiary Minera Quebrada de Oro S.A.). The survey was conducted in two grids of 300 m separated east-west oriented lines of 100 m spaced stations, reflecting the separated tenement holdings at that time. Seven section lines were acquired in the western grid, and twenty one section lines in the eastern grid.  MAPING Ltda. of Santiago was contracted by Hudbay during June 2012 to complete a ground magnetometry survey over three separate areas. The larger area covered the La Varde mine area with 65 east-west oriented, 25 m spaced lines. A smaller area over the San Antonio deposit was covered with seven east-west lines at a 50 m spacing. Further to the south, in the area referred to by the company as Panacea, a similar size area was covered by eight east-west 50 m spaced lines. Magnetometry data on all lines was acquired at 1 second intervals, equivalent to a lateral spacing of approximately 1.4 m.
Further work	The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).  Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Additional work currently being across the Domeyko Project includes (but is not limited to) detailed litho-structural mapping, additional extensional and infill soil geochemistry, twinning of existing drillholes and further exploration drilling.
